

NARESH TULLIBILLI

AWS Cloud Administrator | Site Reliability Engineer | Linux/Unix | Python & Shell Automation | Datadog Monitoring & Observability
nareshnullibilli@gmail.com | +91-6303963539 | linkedin.com/in/naresh-tullibilli | github.com/Naresh916 | Hyderabad, India

SUMMARY

AWS Certified Solutions Architect – Associate with 3+ years of experience administering and scaling AWS cloud infrastructure (EC2, S3, EBS, VPC, IAM) with a strong Site Reliability Engineering focus. Skilled in Linux/Unix systems administration, Python and Shell scripting, and building automation with Ansible to streamline deployments and reduce manual operations. Experienced collaborating with development teams on application deployments and monitoring performance, availability, and end-to-end observability using Datadog (APM, Log Management, Dashboards, and Monitors), alongside Prometheus, Grafana, and CloudWatch, and troubleshooting latency and scalability issues in production. Track record of cutting incident response time by 40% through Datadog-driven alerting and root-cause analysis, sustaining 99.9% uptime across multi-region environments, and reducing release cycle times by 30%. Working knowledge of Docker and Kubernetes (EKS) for containerized workloads.

TECHNICAL SKILLS

- **Cloud Platforms (AWS):** EC2, S3, EBS, VPC, IAM, Route 53, RDS, Lambda, EventBridge, CloudWatch, CloudTrail, SNS
- **Operating Systems:** Linux/Unix (RHEL, Ubuntu, Amazon Linux), systems administration, performance tuning
- **Scripting & Automation:** Python, Bash/Shell Scripting, Ansible playbooks, Terraform, AWS CloudFormation
- **Datadog:** APM & Distributed Tracing, Log Management, Custom Dashboards, Monitors & Alerting, SLOs, Synthetic Monitoring
- **Site Reliability & Monitoring:** Prometheus, Grafana, AWS CloudWatch, incident response, on-call alerting
- **CI/CD:** Jenkins, AWS CodePipeline, AWS CodeBuild, Maven, Git, GitFlow
- **Containers & Orchestration:** Docker, Kubernetes (EKS), Helm, Horizontal Pod Autoscaler
- **Security & DevSecOps:** SonarQube, Trivy, OWASP, IAM policies, vulnerability scanning, Shift-Left security
- **ITSM & Process:** ServiceNow, ITIL, Change Management, Agile/Scrum

EXPERIENCE

DevOps Engineer | Coforge

March 2023 – Present

- Administer and scale AWS cloud infrastructure across multiple regions using Terraform and native AWS services (EC2, S3, EBS, VPC, IAM), improving environment consistency across development, staging, and production.
- Collaborate closely with development teams to deploy microservice-based applications on AWS EKS with rolling updates and horizontal pod autoscaling, achieving zero-downtime production releases.
- Deployed and administered Datadog across EC2, EKS, and Lambda environments, unifying infrastructure metrics, APM traces, and logs into a single pane of glass and cutting incident response time by ~40%.
- Instrumented 10+ microservices with Datadog APM and distributed tracing, correlating traces, metrics, and logs to pinpoint latency bottlenecks and reduce mean-time-to-resolution (MTTR) for production incidents.
- Built and maintained 15+ custom Datadog dashboards and Service Level Objectives (SLOs) for latency, error rate, and throughput, giving engineering and leadership real-time visibility into service health.
- Configured Datadog Monitors (threshold, anomaly-detection, and forecast-based) with multi-channel alerting to Slack and email, cutting alert noise and false positives by ~25% while improving on-call responsiveness.
- Centralized application and infrastructure logs using Datadog Log Management with custom pipelines and log-based metrics, accelerating root-cause analysis during production incidents.
- Monitor application performance, availability, and latency using Prometheus and Grafana dashboards alongside Datadog, enabling earlier issue detection across the monitoring stack.
- Develop Python and Shell automation scripts and Ansible playbooks for configuration management across multiple servers, reducing manual operational overhead and standardizing environments.
- Maintained CI/CD pipelines using Jenkins and Maven, enabling multiple daily releases and reducing overall release cycles by ~30%.
- Containerized 10+ microservices using Docker, standardizing environments and reducing configuration-related deployment issues.

- Integrated SonarQube and Trivy security scans into CI/CD pipelines for early detection of code vulnerabilities and container image risks.
- Implemented AWS SNS-based alerting integrated with Slack and email, improving on-call visibility and response times for production issues.
- Monitored AWS Health events and service notifications proactively to identify potential disruptions and support timely mitigation, sustaining 99.9% uptime.
- Established a GitFlow-based branching strategy across teams, improving code review processes and reducing merge-related release issues.

AWS Cloud Engineer | Coforge

August 2022 – February 2023

- Provisioned and administered 50+ EC2 instances across multiple AWS regions with auto-scaling and fault-tolerant configurations, maintaining ~99.9% environment uptime — core Linux/Unix system administration on production workloads.
- Supported Amazon EKS clusters running containerized workloads, focusing on cluster stability, high availability, and production performance.
- Set up early Datadog infrastructure monitoring and host-level dashboards for EC2 and EKS worker nodes, improving visibility into CPU, memory, and network utilization ahead of scaling events.
- Automated EC2 instance start/stop schedules using AWS Lambda and EventBridge Python scripts, reducing idle resource costs and optimizing cloud spend.
- Implemented EKS worker node upgrades using AWS CloudFormation, ensuring repeatable, low-impact deployments on running workloads.
- Optimized cloud spend through continuous cost analysis, right-sizing instances, and configuring on-demand vs. reserved instance strategies.
- Followed formal change management processes in ServiceNow ITSM, ensuring required approvals and minimal production disruption for all changes.

PROJECT

DevSecOps CI/CD Pipeline – Hotstar-Style Deployment on AWS EKS | *Personal Project*

- Engineered a fully automated 8-stage Jenkins pipeline (SCM checkout, build, SonarQube analysis, quality gate, Trivy FS scan, Docker build, Trivy image scan, EKS deploy), achieving hands-free deployment from commit to production.
- Enforced Shift-Left DevSecOps practices: SonarQube quality gates blocked low-coverage code, and dual-layer Trivy scanning ensured zero critical CVEs reached the EKS cluster.
- Reduced Docker image size from 590 MB to 40 MB (93% reduction) using multi-stage Alpine builds, cutting image pull time by 80%.
- Configured Kubernetes HPA and resource quotas on EKS for auto-scaling under load, ensuring high availability during peak traffic.

Tech Stack: Jenkins, Docker, Amazon EKS, Kubernetes, Helm, SonarQube, Trivy, Terraform, AWS CLI, React 18

CERTIFICATIONS

- AWS Certified Solutions Architect – Associate (SAA-C03), Amazon Web Services, 2024
- Terraform Associate Training – IaC modules, remote state management, workspaces, multi-cloud provisioning
- Kubernetes and Docker Training – Container orchestration, Amazon EKS cluster management, microservices deployment
- CI/CD with Jenkins Training – Pipeline automation, Maven and Git integration, security plugin configuration

EDUCATION

Bachelor of Technology (B.Tech) – Computer Science and Engineering

Narasaraopet Institute of Technology, Andhra Pradesh, India | Jun 2018 – Jun 2022
